Using Natural Language Processing to Analyze News Bias

Bradley Erickson

May 1, 2020

Abstract

As we live in the information age, finding reliable information becomes more and more difficult. All news sources contain bias, thus anything someone reads could be misinformation or interpreted differently. This research scrapes thousands of articles from many sources relating to 5 controversial topics: the impeachment, abortion, immigration, gun control, and climate change. We use unsupervised learning techniques to rank and filter out the top sentences by giving more weight to unbiased, more credible sources. This information will form an extractive-based summary. Finally, we compare the language used among 3 bias groups: left bias, no bias, and right bias. The research provides insights into the current bias state of news reporting.

Disclaimer

The information displayed in the paper is for research purposes. The views do not reflect those of the author or Winona State University.

I Introduction

I.a Background

In the information age, we are bombarded with news every day. However, all news sources show some form of bias and some are not as reliable as others. How can humans be sure they are getting all the correct information from the vast amount of sources? We will combine research on bias and reliability with computer generated summaries to try and provide a reliable unbiased summary of any given topic.

I.b Data

For news source bias and reliability, we use data from Ad Fontes Media. This online group, led by Vanessa Otero, carefully analyzes news articles to assign a rating on both quality and bias [Otero]. Members will report the quality based on 4 attributes: type of information, truthiness, presence of opinion, and unfairness. Additionally, they will rate bias on topic selection and presentation, verbiage used, and comparing to other articles of similar topics. The final data consists of 3 columns: Source, Bias, and Reliability. Bias is on a -42, extreme left, to 42, extreme right, point scale with values close to 0 showing little to no bias. Reliability is on a 0, fabricated data, to 64, reporting facts, point scale.
To analyze individual topics, we use web-scraping to scrape articles. The final data set consists of 4,692 articles on the impeachment; 2,364 articles on abortion; 2,375 articles on immigration; 2,361 articles on gun control; and 2,281 articles on climate. There are 14,073 total articles from 53 different sources.

II Methods

II.a Scraping

For the scraping process, we used the Google Search API and ScrapingHub, an online article web-scraping tool. To begin, we manually gathered the site domain name of 53 different news sources that were included in the bias ratings data. There was not a specific process for which sources were included, but if a source was included from one side of the spectrum, then a source from the other side of the spectrum with a similar reliability rating was also included. A complete list of news sources used can be found in the appendix. Next, we took the sources and used Google's advanced string search capability to gather links of articles from each site. For data on the impeachment, we used a date range

of September 1st 2019 to February 14th, 2020. For all other topics, we used the year of 2019. An example of a search query is shown below.

Example. *site:news-source.com after:2019-01-01 before: 2019-12-31 "search term"*

The example will output links about *search term* from *news-source.com* during the year of 2019. The top 50 results were kept from each query. Some topics used multiple search terms because of the complexity. The following search terms were used:

1. "impeachment"
2. "abortion"
3. "immigration"
4. "gun control" OR "second amendment"
5. "climate change" OR "global warming" OR "environmental policy"

With the approximate 13,000 links scraped, we use ScrapingHub to return the information at each URL. While there is a vast amount of data returned, only the body of the article, source, and URL are kept. ScrapingHub could only scrape data from 14,073 of 15,500 links. The data is stored based on topic into different JSON files.

II.b Article Summarizer

II.b.1 Extractive vs. abstractive

There are two approaches to creating summaries from articles: extractive and abstractive. Extractive-based summarizers will scan the entire article looking for the most important sentences, remove like-sentences, and output sentences directly from the article. Abstractive-based summarizers will scan articles for the important ideas, and write a new summary, similar to how a human would do so. The abstractive-based methods require our model to follow sentence and grammar syntax, thus increasing the complexity. For this analysis, we will use the extractive-based method. Typically this method is only deployed to create a summary for a single article, whereas we will be using this technique to create a single summary for thousands of articles.

II.b.2 Scoring sentences

To determine which sentences are the most important, we will calculate sentence scores based on word usage and news source bias. First, we will calculate a constant for each news source to use when scoring. We do this with the following equation:

$$news_constant = \left(1 - \frac{|bias|}{42}\right) \times \frac{quality}{64} \quad (1)$$

With this equation, the news sources that have little to no bias and are score highly in quality will have a constant closer to 1. Since we are aiming for an unbiased summary, we want to penalize sources for being unreliable or very bias. When doing the process of scoring words and sentences, the *news_constant* will give less weight to the least desirable sources. Thus, when our summary chooses sentences, it will focus more on these sources. Next, we will do two passes through the dataset to determine word and sentence scores. On the first pass, we increment word counts by one times the article's respective *news_constant*. During the process, we ignore all stopwords, i.e. the, is, what, etc. We normalize our word count dictionary to be on a 0 to 1 scale. On the second pass of the data, we calculate the position of the sentence in relation to the article and the sentence score. For each sentence, we aggregate the word values from within and multiply by the *news_constant*. The position is located by taking the index, starting at 0, of the sentence divided by the total number of sentences in the article. Below is a basic example of this process.

Example. *Let's assume we have bias* $= -2$ *and quality* $= 48$*. Using equation 1, we calculate:*

$$news_constant = \left(1 - \frac{|-2|}{42}\right) \times \frac{48}{64} = 0.714$$

Say we have a the following sentences from the same article:

1. *News sources often show bias.*
2. *Paying attention to news is important.*

On our first pass of the data, we calculate each word score. This will be 0.714 multiplied by the number of instances.
News: $0.714 \times 2 = 1.428$
Sources, often, show, bias, paying, attention, important: $0.714 \times 1 = 0.714$ *each*
"To" and "is" are not counted because they are

stopwords. We normalize the scores, so "news" will be 1 *and all others will be* 0.5*. On our second pass, we calculate the sentence score by summing the word scores and multiplying by the news_constant.*

1. $(1 + 0.5 + 0.5 + 0.5 + 0.5) \times 0.714 = 2.142$
2. $(0.5 + 0.5 + 1 + 0.5) \times 0.714 = 1.785$

With a total of 2 sentences in our example, the positions will be $\frac{0}{2} = 0$ *and* $\frac{1}{2} = 0.5$ *respectively.*

II.b.3 Creating the summary

We will first filter out some undesirable sentences and then take the top n sentences, where n is specified, to create the summary, . We do not want any super long sentences in our summary, so we remove all sentences with more 30 or more words. Additionally, some sentences contain picture and video headers from the article, so we remove the sentences with any new lines. Lastly, we do not want to restate information, so we remove similar sentences. We will take the $n \times \lfloor \frac{total_articles}{2} \rfloor$ highest scoring sentences and calculate a cosine similarity matrix. The values in this matrix are on a 0, not similar at all, to 1, extremely similar. Since both the rows and columns are our sentences, every diagonal element in this matrix is 1. One by one will take the highest scoring sentence and remove all lower scoring sentences with a similarity value greater than 0.7. Finally, we take our the top n remaining sentences and reorder them based on their position element.

II.c Graphics

For each our word analysis graphics, we must create a word dictionary based on our articles. We iterate through the groups and create a count for each non-stopword present. Next, we combine each groups counts to create an overall column.

II.c.1 Ternary chart

We will create a ternary charts to compare which words are used by each of the 3 groups. An example of a ternary chart is shown in Figure 1.

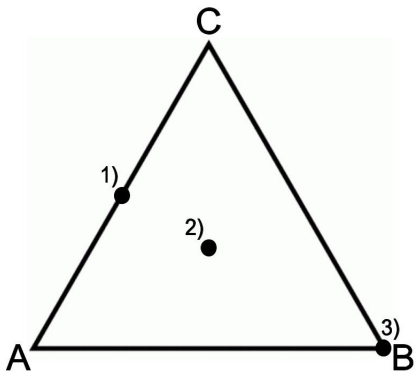

Figure 1: Example of ternary plot.

Each line of the triangle represents an axis on a 0 to 1 scale. Each point will be represented as (%A, %B, %C). Point 1 is used evenly between groups A and C, but not at all by group B: $(0.5, 0, 0.5)$. Point 2 is used evenly between all 3 groups: $(0.\overline{3}, 0.\overline{3}, 0.\overline{3})$. Point 3 is exclusively used by group B: $(0, 1, 0)$.
To reduce clutter on the chart, we will remove all words that have few than 10 overall instances. We must change our counts for each word to a percentage used by each group. First, we determine the percentage a word is used within each group. Then, we create a normalized percentage based on each word. An example is of this is shown below:

Example. *Suppose we have the following data*

word	*left*	*right*	*no bias*	*overall*
bar	*10*	*10*	*0*	*20*
foo	*0*	*90*	*10*	*100*
	10	*100*	*10*	*120*

We calculate our percentages used within each group and get

word	*left*	*right*	*no bias*
bar	*100%*	*10%*	*0%*
foo	*0%*	*90%*	*100%*

To get our normalized percentage for "bar", we will divide each percentage by a total.

$$\textit{Left: } aL = \frac{100}{100+10+0} = 90.1$$
$$\textit{Right: } aR = \frac{10}{100+10+0} = 9.9$$
$$\textit{No bias: } aN = \frac{0}{100+10+0} = 0$$

We do the same for "foo" and get our final adjusted percentiles.

word	*left*	*right*	*no bias*
bar	*90.1%*	*9.9%*	*0%*
foo	*0%*	*47.3%*	*52.7%*

We take these 3 adjusted percentages and map them to our graph's 2-dimensional space. We use the following equations to obtain our (x, y) coordinates:

$$x = \frac{1}{2} \times \frac{2 \times aR + aN}{aL + aR + aN} \tag{2}$$

$$y = \frac{\sqrt{3}}{2} \times \frac{aN}{aL + aR + aN} \tag{3}$$

II.c.2 Word clouds

For each topic, we will create 3 word clouds to further see the difference in word use. We will filter our data on adjusted percentages to analyze words exclusively used by each group. We choose a cut point of 66%. We will manually remove irrelevant words to our topics.

III Results

Each sentence may have a different source, so all sources are located in the appendix. Additionally, all extra words removed from the charts are located in the appendix.

III.a Impeachment

Summary. *(Reuters) - After House Democrats presented their impeachment case against U.S. President Donald Trump for three days this week, Trump's defense team will begin its rebuttal on Saturday. The White House is softening its calls for a lengthy Senate impeachment trial that would include several controversial witnesses just as the House prepares to impeach President Trump. WASHINGTON (Reuters) - The White House unveiled its detailed legal defense as the Republican-controlled U.S. Senate gears up to begin President Donald Trump's impeachment trial on Tuesday. A new phase of President Trump's historic impeachment trial began Wednesday, with senators posing questions to the House managers and the president's attorneys about Trump's conduct toward Ukraine. House Speaker Nancy Pelosi announced Thursday that she has instructed House Democrats to draw up articles of impeachment of President Donald Trump, saying he had abused his power. Wednesday marked the beginning of the next phase in President Donald Trump 's impeachment trial as senators submitted questions to both his defense team and the House impeachment managers. House Democrats filed a brief on Saturday outlining their formal case against President Donald Trump, as the Senate impeachment trial is set to continue next week. Republican lawmakers voted Friday to block witnesses from testifying in the Senate impeachment trial for President Donald Trump, setting up a vote to acquit the president next Wednesday. The House Rules Committee on Tuesday began the next procedural step before a full House vote Wednesday on the articles of impeachment against President Donald Trump. (Reuters) - The Democratic-led U.S. House of Representatives Intelligence Committee had its last public hearing on Thursday in the impeachment inquiry into President Donald Trump's dealings with Ukraine. The impeachment of President Donald Trump in the U.S. House of Representatives will play out over six hours of debate Wednesday, concluding with votes on two articles of impeachment. The Senate impeachment trial of President Trump, expected to begin in earnest next week, is formally about a weighty constitutional question: Has Trump abused the powers of his office? Earlier Wednesday, the House voted 228-193 to formally send the impeachment charges against President Trump to the Senate to begin the third presidential impeachment trial in American history. President Trump calls for Schiff's resignation after the chairman of the House Intelligence Committee paraphrased the White House memo describing Trump's phone call with Ukraine's leader. Commenting on the next stage of impeachment – the Senate's impeachment trial, Trump said he wouldn't mind a long trial and would like to see the whistleblower testify. During the Senate impeachment trial, Trump's lawyers accused Democrats of seeking to remove Trump from office even before he became president in January 2017. In the unlikely event the Senate convicted Trump, Vice President Mike Pence would become president for the remainder of Trump's term, which ends on Jan. 20, 2021. The allegations that Trump tied the aid to investigations, which the president has denied, would undermine the White House's defense of the president in the impeachment trial. In the unlikely event the Senate convicted Trump, Vice President Mike Pence would become president for the remainder of Trump's term, which ends on Jan. 20, 2021. In the unlikely event the Senate convicts Trump, Vice President Mike Pence would become president for the remainder of Trump's term, which ends on Jan. 20, 2021.*

III.b Abortion

Summary. *As Republican-led states pass laws restricting abortion in hopes the Supreme Court will overturn its Roe v. Wade decision, supporters of abortion rights are pushing back. Abortion-rights supporters say the rules are arbitrary and are intended to shutter abortion clinics, while abortion opponents say they're aimed at protecting women and ensuring proper patient care. Gillibrand's remarks came at a roundtable discussion with abortion providers and physicians, Georgia legislators and women's rights activists following the passage of new "heartbeat" abortion legislation in the state. Abortion rights advocates say Indiana's fetal remains requirements will drive up costs for abortion clinics and in turn for patients seeking abortion care. If Roe is overturned, it will throw state abortion laws into chaos, and lawsuits over abortion rights (and abortion restrictions) will proliferate. However fiercely abortion advocates may cling to the claim that abortion is "safe," the truth is that surgical abortion is a procedure that can put women's lives in jeopardy. "Indiana has enacted abortion restriction on top of abortion restriction, further and further curtailing the constitutional right to an abortion," the lawsuit reads, according to the South Bend Tribune. "This is a time of nearly unprecedented attacks on abortion access, targeting clinics like us," said Amanda Kifferly, vice president for abortion access at The Women's Centers. Would the rightwing justices on the court take a law like Alabama's wholesale ban on abortion as an opportunity to do away with abortion rights for American women? Now Planned Parenthood, which operates that final abortion clinic,*

said Tuesday it will be forced to end its abortion services altogether by Friday if the state suspends its license. Abortion rights advocates have argued that restrictions such as requiring admitting privileges for doctors are meant to limit access to abortion, not protect women's health. The court order would mean health providers would be able to offer abortion and post-abortion care services without the fear of being prosecuted, said Opondo. Abortion rights advocates worry that women like Arlen and S. could be prosecuted for running afoul of laws and regulations surrounding abortion and abortion pills. The Abortion Care Finder shows the nearest Planned Parenthood abortion clinics and explains any relevant state laws and abortion methods, as well as clinic-specific services and financial assistance. Several states have passed laws seeking to ban abortion weeks before viability, and an Alabama law that's scheduled to take effect in November would ban abortion with few exceptions.

III.c Immigration

Summary. *(Reuters) - President Donald Trump said on Friday mass deportation roundups would begin "fairly soon" as U.S. migrant advocates vowed their communities would be "ready" when immigration officers come. WASHINGTON (Reuters) - President Donald Trump said on Monday that U.S. authorities would begin next week removing millions of immigrants who are in the United States illegally. The Trump administration's top official for legal immigration said Thursday that former Speaker Paul Ryan (R-Wis.) is responsible for congressional inaction on immigration reform. The Trump administration proposed new immigration rules Monday for temporary agricultural workers that officials said would make it easier for employers to apply for the visas. President Donald Trump confirmed Friday that Immigration and Customs Enforcement agents would conduct weekend raids this Sunday to deport immigrants with outstanding orders to leave the country. Among them were U.S. Customs and Border Protection, or CBP — which patrols the U.S.-Canada border in New York — and U.S. Immigration and Customs Enforcement, or ICE. According to Charles Wheeler, Director of the Catholic Legal Immigration Network Inc., "The Trump administration is trying to bypass Congress and implement its own merit based-immigration system. White House advisers, including senior adviser Stephen Miller, have long advocated for legal immigration restrictions, even as the president has said he supported expanding legal immigration. White House advisers, including senior adviser Stephen Miller, have long advocated for legal immigration restrictions, even as the president has said he supported expanding legal immigration. White House advisers, including senior adviser Stephen Miller, have long advocated for legal immigration restrictions, even as the president has said he supported expanding legal immigration. "Immigration restrictionists understand that things like catch and release, the visa lottery and legal immigration numbers all matter more than building the wall," said one former Trump administration official. Trump's plan would keep legal immigration steady at 1.1 million people a year, but family-based immigration would account for only a third of that. The new rule is a "policy to reduce immigration by people who aren't wealthy, and to shift immigration from Latin America and Asia to Europe," Lucia said. Beto O'Rourke has also proposed an immigration plan that says he would use executive authority as president to reverse key Trump administration policy positions on immigration. "Cuccinelli was an unusual choice, given his lack of immigration experience," said Mark Krikorian, executive director of the Center for Immigration Studies, which favors lower levels of immigration.*

III.d Gun Control

Summary. *At a gun policy forum in Nevada, Cory Booker said the National Rifle Association and the corporate gun lobby are not the only forces stopping progress on gun control. There is public support for universal background checks for gun purchases, extreme risk protection orders (also called red flag laws), gun licensing, assault-weapons bans and bans on high-capacity magazines. Twenty states passed some form of gun regulation last year, including nine states with a Republican governor, according to the gun control group Everytown for Gun Safety. Those who attended the rally said such gun-control measures would do little to reduce mass shootings and other crimes, but instead would punish responsible gun owners. "Without the support of gun owners, it's unlikely that Donald Trump would ever have been elected," said Adam Winkler, a UCLA law professor who researches politics and gun laws. Derek Wills, who hosts the pro-gun podcast Lone Star Gun Talk, said he too is worried to hear Texas Republicans suggest gun control concessions. The Violence Policy Center has reported that states with the toughest gun laws also tend to have lower rates of gun ownership and lower rates of gun deaths. "We continue to defeat gun control legislation across the country while passing gun rights legislation," said NRA spokeswoman Jennifer Baker. Even under Germany's current gun laws, which require training and a permit to buy a gun, nearly 800 people considered far-right extremists held gun permits as of 2018. These include the Gun Violence Prevention Research Act and National Gun Violence Research Act, which also would create a National Gun Violence Research program. CHANG: Now, both the U.S. and New Zealand have robust gun cultures, but why do you think gun owners here seem more resistant to changes in gun control laws? Trump called the shooter "a very sick person," but said background checks on gun buyers would not have prevented recent gun violence. It also would boost federal funding for gun violence research, which has been limited since 1996 under a law prohibiting the use of federal funds to promote gun control. MAK: In one of the surprises of the 2018 midterms, gun control advocates like Everytown For Gun Safety outspent gun rights advocates like the NRA. Philip Alpers, a Sydney University gun policy analyst, said New Zealand had rejected the most important reform among a raft of gun restrictions that halved Australia's gun death rate.*

III.e Climate Change

Summary. *"That could be anything, [from] where climate change is impacting the crops we purchase, to water availability driven by climate change," says Brian Nash, Ingredion's head of sustainability. The Yale Program on Climate Change Communication and the George Mason University Center for Climate Change Communication have been studying public responses to global warming for over a decade. Climate scientists around the world have raised the alarm about the danger of climate change and a warming climate in the last year. "European citizens are highly concerned about climate change and its impact on their everyday life and future," said Emma Navarro, EIB Vice-President responsible for climate action and the environment. Climate change is becoming more of a national priority among Democrats but not Republicans, said Tony Leiserowitz, director of the Yale Program on Climate Change Communication. As co-chair of the New Democrat Coalition's Climate Change Task Force, I helped lead the effort to create policy principles and legislation to combat climate change. While the White House struck one phrase attributing extreme weather events to climate change, the document still refers to "climate change" and "a changing climate" 22 times. In addition, the researchers said, even as climate change makes agriculture more difficult, agriculture itself is also exacerbating climate change. I'll admit I did not come to the agency as a climate change expert ... I'll admit, there is a lot I don't understand about climate change," he said. "Global warming" was searched far more often than "climate change" up until the early 2010s, when "climate change" finally caught up. "Climate migration is the human face of climate change," said Ama Francis, a climate law fellow at Columbia's Sabin Center for Climate Change Law. Climate change may be a global issue, but evaluating the economic inequities of climate change in poorer versus wealthier countries is an important step in taking action. "One of the big challenges of climate change is the many ways the people who are least responsible for climate change are the most affected," he said. "I refuse to postpone any longer taking on climate change and leading the world in taking on climate change," Biden said Sept. 12. And it's going to continue to change and that pace of change is going to speed up," said HES climate change scientist, David Harkin.*

IV Discussion

The extracted summaries seem to present the relevant information well, but the flow is very off. For example, in the impeachment summary, we often have dates or days of the week thrown around. While the sentences containing this information may be deemed important, we do not have any indication for which week they are speaking of. Additionally, the events are out of order. The mention of drawing up documents to begin the process appears after speaking about the trials. These two should be flipped based on how the real order of events. The other topics present similar interrupts in flow. For the graphics, we encounter many irrelevant words. Since our data is scraped from news sites, there is a chance that a lot of noise could be introduced. For example, a scraped article could be a recap of the news, and thus, the article might include irrelevant words. Also, the articles might be littered with their respective new source name. With the scraped data, we may also encounter html tags such as *photos, video, ad, etc.*. The word clouds give information into who the different groups are talking about. The abortion word clouds show this. For the no bias cloud, we see Kagan is a supreme court justice who is often talked about with the topic of abortion. Tiller is a pro-abortion doctor who was assissinated in 2009. For the left bias cloud, we see Edwards who is the Louisianna Governor. For the right bias cloud, we see some of the more prominent words when someone thinks about this topic.

V Future work

This work can be improved upon in various ways. As mentioned previously, we have various anomalies in our data. We could create methods for determining if an article is a recap, interview, or video only. We can simply expand on both topics and sources for our analysis. Perhaps, we could branch into less polarizing issues. Additionally, we could explore different news source constant functions. Finally, we could attempt to create an abstractive summary instead of simply extracting sentences from articles.
